

TEST REPORT

Test Report No. : UL-RPT-RP11265293JD07AD V2.0

Manufacturer : Apple Inc.
Model No. : A1785
FCC ID : BCG-E3088A
Technology : CDMA BC1
Test Standard(s) : FCC Part 24 Subpart E

1. This test report shall not be reproduced in full or partial, without the written approval of UL VS LTD.
2. The results in this report apply only to the sample(s) tested.
3. The sample tested is in compliance with the above standard(s).
4. The test results in this report are traceable to the national or international standards.
5. Version 2.0 supersedes all previous versions,

Date of Issue: 03 August 2016

Checked by:

Ian Watch
Senior Engineer, Radio Laboratory

Company Signatory:

Steven White
Service Lead, Radio Laboratory
UL VS LTD

This laboratory is accredited by UKAS.
The tests reported herein have been
performed in accordance with its terms
of accreditation.

1. Customer Information

Company Name:	Apple Inc.
Address:	1 Infinite Loop Cupertino, CA 95014 U.S.A

2. Summary of Testing

2.1. General Information

Specification Reference:	47CFR24
Specification Title:	Code of Federal Regulations Volume 47 (Telecommunications): Part 24 Subpart E (Personal Communication Services)
Site Registration:	209735
Location of Testing:	UL VS LTD, Unit 3 Horizon, Wade Road, Kingsland Business Park, Basingstoke, Hampshire, RG24 8AH, United Kingdom
Test Dates:	12 July 2016 to 21 July 2016

2.2. Summary of Test Results

FCC Reference	Measurement	Result
Part 24.232(c)	Transmitter Output Power and E.I.R.P.	
Part 24.232(d)	Transmitter Peak-to-Average Power Ratio (PAPR)	
Part 2.1049	Transmitter Occupied Bandwidth	
Part 2.1053 / 24.238	Transmitter Out of Band Radiated Emissions	
Part 2.1053 / 24.238	Transmitter Band Edge Radiated Emissions	
Part 2.1055 / 24.235	Transmitter Frequency Stability (Temperature and Voltage Variation)	
Key to Results  = Complied  = Did not comply		

2.3. Methods and Procedures

Reference:	FCC KDB 971168 D01 v02r02, October 17 2014
Title:	Measurement Guidance for Certification of Licensed Digital Transmitters

2.4. Deviations from the Test Specification

For the measurements contained within this test report, there were no deviations from, additions to, or exclusions from the test specification identified above.

3. Equipment Under Test (EUT)

3.1. Identification of Equipment Under Test (EUT)

Brand Name:	Apple
Model Name or Number:	A1785
Test Sample ESN:	80153A37 (<i>Conducted sample #42</i>)
Test Sample MEID:	35864007028548
Hardware version:	REV1.0
Software Version:	iOS: 14A298, BB FW: 0.25.02
FCC ID:	BCG-E3088A

Brand Name:	Apple
Model Name or Number:	A1785
Test Sample ESN:	80AAEEAB (<i>Radiated sample #61</i>)
Test Sample MEID:	35864007009801
Hardware version:	REV1.0
Software Version:	iOS: 14A298, BB FW: 0.25.02
FCC ID:	BCG-E3088A

Brand Name:	Apple
Model Name or Number:	A1785
Test Sample ESN:	8025CABB (<i>Radiated sample #59</i>)
Test Sample MEID:	35864007026953
Hardware version:	REV1.0
Software Version:	iOS: 14A298, BB FW: 0.25.02
FCC ID:	BCG-E3088A

3.2. Description of EUT

The Equipment Under Test was a mobile phone with GSM/GPRS/EGPRS/UMTS/LTE/TD-SCDMA and CDMA technologies. It also supports IEEE 802.11a/b/g/n/ac, Bluetooth®, GPS and NFC. The rechargeable battery is not user accessible.

3.3. Modifications Incorporated in the EUT

No modifications were applied to the EUT during testing.

3.4. Additional Information Related to Testing

Technology Tested:	CDMA BC1		
Type of Radio Device:	Transceiver		
Modes:	1xRTT, EV-DO Rev 0 & EV-DO Rev A		
Modulation Type:	O-QPSK & H-PSK		
Power Supply Requirement(s):	Nominal	3.8 VDC	
	Minimum	3.4 VDC	
	Maximum	4.3 VDC	
Transmit Frequency Range:	1850 to 1910 MHz		
Transmit Channels Tested:	Channel ID	Channel Number	Channel Frequency (MHz)
	Bottom	25	1851.25
	Middle	600	1880.0
	Top	1175	1908.75

3.5. Support Equipment

The following support equipment was used to exercise the EUT during testing:

Description:	Laptop PC
Brand Name:	Thinkpad
Model Name or Number:	Lenovo L440
Serial Number:	R9-019EA2 14/4

Description:	USB diagnostic cable
Brand Name:	Not stated
Model Name or Number:	Kong
Serial Number:	2074F9

Description:	Personal Hands Free (PHF)
Brand Name:	Apple
Model Name or Number:	Apple Ear Plugs
Serial Number:	Not stated

4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

- Constantly transmitting at full power on bottom, middle and top channels as required.
- Occupied bandwidth, conducted power and band edge tests were performed with the EUT in 1xRTT and EV-DO modes.
- Transmitter radiated spurious emissions were checked in all modes during pre-scans. 1xRTT RC 1/1 was found to be the worst case and all final measurements were performed with the EUT in this mode.

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- The EUT was placed into a non-ui mode by using the teraterm application on a UL laptop PC. Instructions were provided by the customer to enable the baseband and radio (*Cellular_RSE_setup_V3.0.doc*). This enabled the EUT to connect via a radiated link with the Rohde & Schwarz CMW 500 system simulator operating in transceiver mode. The CMW 500 was used to configure the EUT operating mode.
- Transmitter radiated spurious emissions tests were performed with the PHF connected to the EUT as the declared by the customer. The EUT was placed in three orthogonal orientations X, Y and Z to determine the worst case orientation for radiated spurious emissions. The worst case orientation for the LAT was Z and for the UAT was Z. Measurements at band edges were performed with the PHF removed as this was found to be the worst case.
- The worst-case radiated emission among all accessories, is determined by the manufacturer to be with the headset connected. The compliance lab performed final testing only with the headset attached.
- Testing for frequency stability and measurements at temperature and voltage extremes was performed using a conducted sample supplied by the customer. Short 4-wire DC flying leads were connected internally to the device in place of the battery, and exited through a hole in the casing. These leads were then extended to a DC power supply for testing purposes.
- For conducted cellular measurements, the RF conducted port was created by removing a micro connector from the PCB antenna and extending it with a short flexible microstrip supplied by the customer. This microstrip exited the device through a hole in the casing and was terminated in a proprietary micro-coax to SMA adaptor.
- The device contains two cellular antennas which do not transmit simultaneously.
 - LAT – Lower Antenna (Primary)
 - UAT – Upper Antenna (Secondary)
- Where applicable, both antennas have been tested to demonstrate compliance

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6. Measurement Uncertainty* for details.

In accordance with UKAS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

5.2. Test Results

5.2.1. Transmitter Output Power and E.I.R.P. - LAT

Test Summary:

Test Engineer:	John Ferdinand	Test Dates:	14 July 2016 to 19 July 2016
Test Sample ESN:	80153A37		

FCC Reference:	Part 24.232(c)
Test Method Used:	KDB 971168 D01Section 2.2 footnote 1 & notes below

Environmental Conditions:

Temperature (°C):	21 to 24
Relative Humidity (%):	39 to 43

Note(s):

1. Transmitter average output power was measured using a Rohde & Schwarz CMW 500 following current Rohde & Schwarz measurement procedures. All configurations were tested with the EUT transmitting at maximum power on the bottom, middle and top channels. An RF level offset was entered on the CMW 500 to compensate for the loss of the attenuator and RF cables.
2. The manufacturer stated a maximum antenna gain of 0.9 dBi. The antenna gain was added to the conducted output power to obtain the radiated power. The highest power recorded was subtracted from the limit to show the margin.

Test setup:

Transmitter E.I.R.P. (continued)**Results: 1xRTT**

5.2.3. Transmitter Peak-To-Average Power Ratio (PAPR)**Test Summary:**

Test Engineer:	John Ferdinand	Test Date:	18 July 2016
Test Sample ESN:	80153A37		

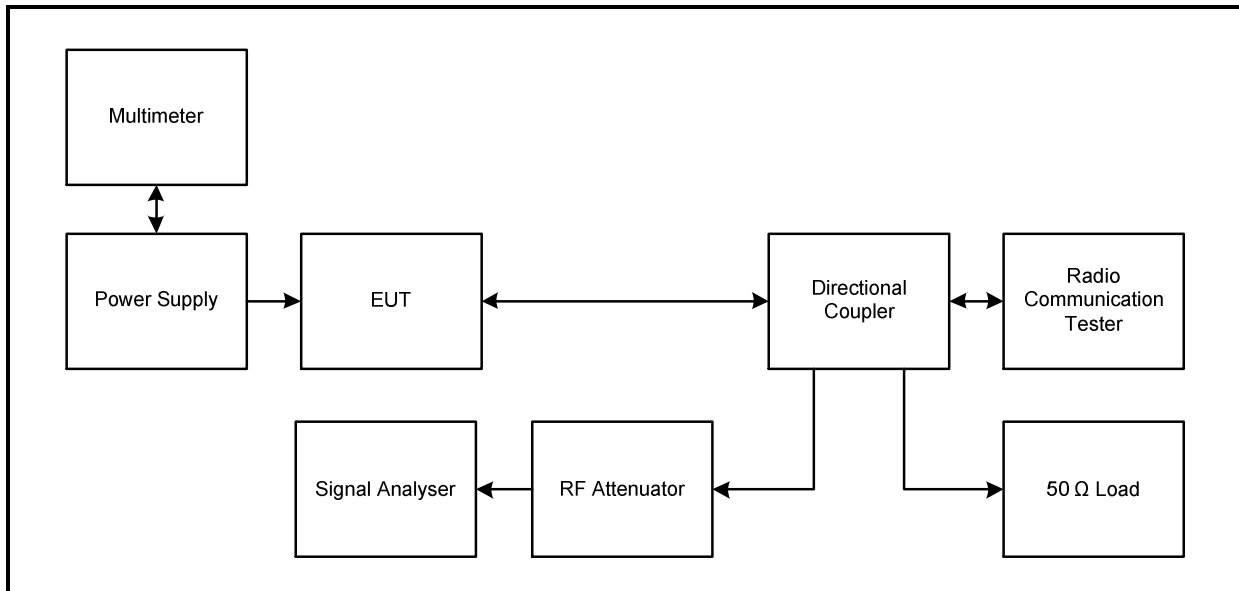

FCC Reference:	24.232(d)
Test Method Used:	KDB 971168 D01Section 5.7.1

Environmental Conditions:

Temperature (°C):	20 to 22
Relative Humidity (%):	39 to 40

Note(s):

1. The CCDF function of a signal analyser was used to measure PAPR when the EUT was transmitting in 1xRTT and EV-DO modes. Maximum PAPR levels associated with a probability of 0.1% were recorded.
2. The signal analyser was connected to the RF port on the EUT via the coupled port of an RF coupler using suitable attenuation and RF cables. An RF level offset was entered on the signal analyser to compensate for the loss of the coupler, attenuator and RF cables

Test setup:

Transmitter Peak-To-Average Power Ratio (continued)**Results: 1xRTT**

Channel	Frequency (MHz)	PAPR (dB)	PAPR Limit (dB)	Margin (dB)	Result
Bottom	1851.25	3.54	13.0	9.46	Complied

5.2.4. Transmitter Occupied Bandwidth**Test Summary:**

Test Engineer:	John Ferdinand	Test Date:	18 July 2016
Test Sample ESN:	80153A37		

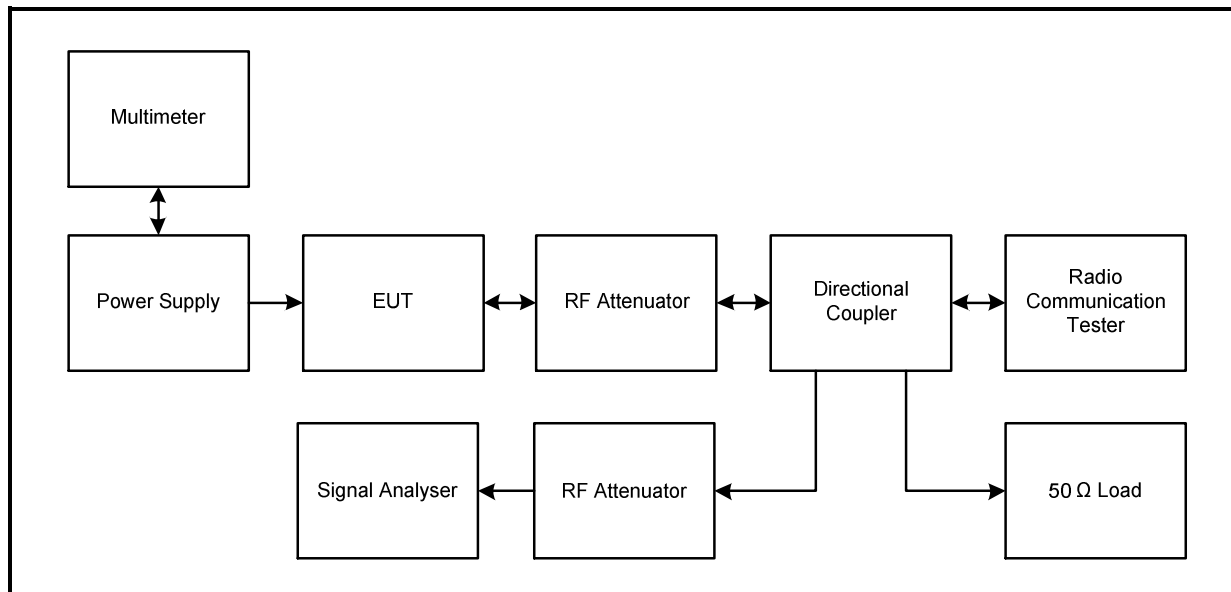

FCC Reference:	Part 2.1049
Test Method Used:	FCC KDB 971168 D01 Sections 4.1 & 4.2

Environmental Conditions:

Temperature (°C):	19 to 24
Relative Humidity (%):	39 to 43

Note(s):

1. Occupied bandwidth (99% bandwidth) was measured using a signal analyser occupied bandwidth function. -26 dB bandwidths were also measured and recorded.
2. The RF port of the EUT was connected to the signal analyser via RF cables, directional coupler and suitable attenuation.

Test setup:

Transmitter Occupied Bandwidth (continued)**Results: 1xRTT**

Channel	Frequency (MHz)	99% Occupied Bandwidth (kHz)	-26 dB Bandwidth (kHz)
Bottom	1851.25	1280.753	1447.200

5.2.5. Transmitter Out of Band Radiated Emissions - LAT**Test Summary:**

Test Engineer:	John Ferdinand	Test Dates:	12 July 2016 to 14 July 2016
Test Sample ESN:	80AAEEAB		

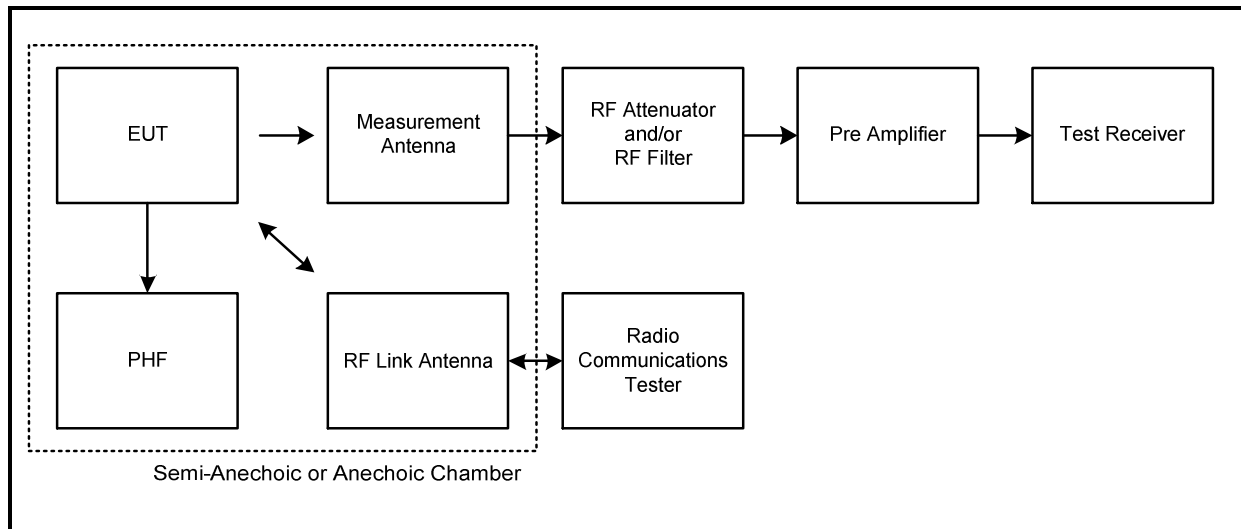

FCC Reference:	Parts 2.1053 & 24.238
Test Method Used:	Part 24.238(b), KDB 971168 D01Section 6, Section 7 & Notes below
Frequency Range:	30 MHz to 19.1 GHz
Configuration:	1xRTT RC1/1

Environmental Conditions:

Temperature (°C):	21 to 24
Relative Humidity (%):	39 to 43

Note(s):

1. The uplink traffic channel is shown on the 1 GHz to 3 GHz plot.
2. All emissions shown on the pre-scan plots were investigated. Final measurements were made using appropriate RF filters and attenuators where required.
3. Middle channel results are recorded in this report and are representative of bottom and top channel results which are held on the UL IT server and available for inspection on request.
4. Pre-scans were performed in a fully anechoic chamber (Asset Number K0002) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the test chamber floor in the centre of the chamber turntable. All measurement antennas were placed at a fixed height of 1.5 metres above the test chamber floor, in line with the EUT. Final measurements were performed in a semi-anechoic chamber (Asset Number K0017) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres. The test receiver resolution bandwidth was set to 1 MHz and video bandwidth 3 MHz, with the sweep time set to auto. A peak detector and trace mode of Max Hold were used to perform pre-scans, with markers placed on the highest measured levels. Final measurements were performed on the marker frequencies using an average detector and the results entered into the tables below.
5. Radiated spurious emission testing between 150 kHz and 30 MHz was performed for support of the NFC test report. No spurious emissions were observed above the noise floor of the measurement system.

5.2.6. Transmitter Out of Band Radiated Emissions - UAT**Test Summary:**

Test Engineer:	John Ferdinand	Test Dates:	12 July 2016 to 14 July 2016
Test Sample ESN:	8025CABB		

FCC Reference:	Parts 2.1053 & 24.238
Test Method Used:	Part 24.238(b), KDB 971168 D01Section 6, Section 7 & Notes below
Frequency Range:	30 MHz to 19.1 GHz
Configuration:	1xRTT RC1/1

Environmental Conditions:

Temperature (°C):	21 to 24
Relative Humidity (%):	39 to 43

Note(s):

1. The uplink traffic channel is shown on the 1 GHz to 3 GHz plot.
2. All emissions shown on the pre-scan plots were investigated. All emissions shown on the pre-scan plots were found to be below the measurement system noise floor or ambient or > 20 dB below the applicable limit. Therefore the highest peak noise floor reading of the measuring receiver was recorded in the table below.
3. Middle channel results are recorded in this report and are representative of bottom and top channel results which are held on the UL IT server and available for inspection on request.
4. Pre-scans were performed in a fully anechoic chamber (Asset Number K0002) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the test chamber floor in the centre of the chamber turntable. All measurement antennas were placed at a fixed height of 1.5 metres above the test chamber floor, in line with the EUT. A peak detector and trace mode of Max Hold were used to perform pre-scans, with markers placed on the highest measured levels.
5. Radiated spurious emission testing between 150 kHz and 30 MHz was performed for support of the NFC test report. No spurious emissions were observed above the noise floor of the measurement system.

5.2.7. Transmitter Radiated Emissions at Band Edges - LAT**Test Summary:**

Test Engineer:	John Ferdinand	Test Date:	14 July 2016
Test Sample ESN:	80AAEEAB		

FCC Reference:	Part 2.1053 / 24.238
Test Method Used:	Part 24.238(b), KDB 971168 D01 Section 6, Section 7 & notes below

Environmental Conditions:

Temperature (°C):	21 to 24
Relative Humidity (%):	39 to 43

Note(s):

1. Measurements were performed in a fully anechoic chamber (Asset Number K0002) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the test chamber floor in the centre of the chamber turntable. The measurement antenna was placed at a fixed height of 1.5 metres above the test chamber floor, in line with the EUT.
2. In the first 1.0 MHz immediately outside and adjacent to the band edges, the resolution bandwidth used was greater than 1% of the 26 dB emission bandwidth.

Transmitter Radiated Emissions at Band Edges – LAT (continued)**Results: 1xRTT**

Frequency (MHz)	Peak Level (dBm)	Limit (dBm)	Margin (dB)	Result

5.2.9. Transmitter Frequency Stability (Temperature Variation)**Test Summary:**

Test Engineer:	Stefan Ho	Test Date:	21 July 2016
Test Sample ESN:	80153A37		

FCC Reference:	Part 24.235 and 2.1055
Test Method Used:	KDB 971168 D01Section 9, FCC Part 2.1055 and notes below
Test Mode:	RC1/1 with Service Option 2

Environmental Conditions:

Ambient Temperature (°C):	21
Ambient Relative Humidity (%):	42

Note(s):

1. Flying leads were connected internally to the EUT in place of the battery. These leads were extended and connected to a bench power supply.
2. Frequency error was measured using a calibrated Rohde & Schwarz CMW 500 Universal Radio Communications Tester in accordance with current Rohde & Schwarz application notes. The EUT was connected by suitable RF cables to the CMW 500. A bi-directional communications link was established between the EUT and CMW 500. The frequency meter value was recorded.
3. Temperature was monitored throughout the test with a calibrated digital thermometer. Nominal voltage was monitored throughout the test with a calibrated digital voltmeter.

Test setup:

Transmitter Frequency Stability (Temperature Variation) (continued)**Results: Middle Channel (1880 MHz)**

Temperature (°C)	Measured Frequency (MHz)	Frequency Error (Hz)	Frequency Error (ppm)	Limit (ppm)	Margin (ppm)	Result

6. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
Conducted Output Power	1850 to 1910 MHz	95%	± 1.13 dB
Occupied Bandwidth	1850 to 1910 MHz	95%	± 3.92 %
Radiated Spurious Emissions	30 MHz to 1 GHz	95%	± 5.65 dB
Radiated Spurious Emissions	1 GHz to 19.1 GHz	95%	± 2.94 dB
Frequency Stability	1850 to 1910 MHz	95%	± 23 Hz

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
